Platform
Web Application

1. Product Overview

HireIQ is an AI-powered web application designed to streamline and modernize the end-to-end recruitment process. Built for recruiters and hiring teams, HireIQ enables intelligent resume evaluation, structured job description management, collaborative candidate tracking, and seamless interview scheduling — all within a single unified platform.

By leveraging artificial intelligence for resume parsing and job-description matching, HireIQ dramatically reduces the time-to-shortlist while improving the quality and consistency of hiring decisions. Teams of any size can collaborate efficiently, with managers retaining full visibility through a real-time dashboard.

1.1 Problem Statement

Traditional recruitment workflows are fragmented across spreadsheets, email threads, and disconnected tools. Recruiters spend significant time manually reviewing resumes, updating statuses, and coordinating interviews. HireIQ solves this by bringing every step of the hiring funnel into one intelligent system.

1.2 Key Value Propositions

What HireIQ Delivers

- AI-driven resume-to-JD matching that highlights skill gaps and provides hiring recommendations
- Centralized job description management with collaborative workflow and status tracking
- End-to-end candidate lifecycle management from application to hire or archive
- Integrated Google Meet interview scheduling with in-app link access
- Real-time dashboard giving managers full visibility into hiring pipeline efficiency
- Bulk operations and Excel export to accelerate high-volume hiring decisions

2. Technology Stack & Infrastructure

HireIQ is built on a modern, cloud-native stack designed for scalability, reliability, and rapid iteration. Every layer of the application is deployed on managed cloud infrastructure to minimize operational overhead.

Layer	Technology	Purpose
Frontend	React	Component-based UI framework for a dynamic, responsive user experience
Backend	Python / FastAPI	High-performance async REST API layer powering all business logic
Database & Auth	Supabase	Managed PostgreSQL database with built-in authentication and row-level security
Backend Hosting	Render	Cloud platform for hosting and auto-deploying the FastAPI backend service
Frontend Hosting	Vercel	Edge-optimized hosting for the React frontend with CI/CD integration
File Storage	AWS S3	Secure, scalable object storage for uploaded resume files
Video Meetings	Google Meet API	Third-party integration for generating and managing interview meeting links

2.1 Architecture Summary

The frontend communicates exclusively with the FastAPI backend via RESTful API calls. The backend orchestrates all business logic, AI processing, database reads/writes (via Supabase), and third-party service calls (AWS S3, Google Meet). Resume files are stored directly in AWS S3, with metadata and parsed results persisted in the Supabase database.

3. Application Features

3.1 Authentication — Login Page

HireIQ provides a secure login page as the entry point to the application. All routes are protected and require authenticated sessions before access is granted.

- Email and password-based authentication powered by Supabase Auth
- Session management with secure token handling
- Role-aware access control to differentiate recruiter and manager views

3.2 Dashboard

The Dashboard gives hiring managers and recruiters a high-level, at-a-glance overview of the entire recruitment pipeline. It serves as the home screen after login.

- Visual summary of all open positions and their current hiring status
- Candidate counts broken down by pipeline stage (new, shortlisted, interview scheduled, hired, etc.)
- Position filter to drill down into metrics for a specific job opening
- Work-efficiency indicators to track recruiter productivity across the team
- Manager oversight view to monitor team-level progress without diving into individual records

3.3 Job Description (JD) Management

The JD Management module allows recruiters to create, organize, and track all open positions from a single interface. A recruiter can independently manage multiple positions simultaneously.

Core Capabilities

Feature	Description
Add Positions	Create as many job positions as needed, each with a full job description, role title, and requirements.
Edit JD	Modify any job description at any time to reflect evolving hiring requirements.
JD Status Workflow	Each JD carries a status (e.g., Open, On Hold, Closed) to reflect its current stage in the hiring lifecycle.
Assigned To	Each JD can be assigned to a specific team member, enabling workload distribution and clear ownership.
Manager Overview	Managers can view all JDs across the team from the Dashboard, providing full pipeline visibility.

3.4 Resume Upload & AI-Powered Matching

The resume evaluation module is the core intelligence layer of HireIQ. Recruiters upload one or multiple resumes, select the target JD, and the AI engine performs a comprehensive analysis.

What the AI Extracts

Candidate Information Parsed Automatically

- Full name, email address, and location
- Current job title and current/most recent company
- Total years of experience
- Educational background and qualifications
- Technical skills and competencies listed in the resume

AI Matching Output

- Matching Skills: skills present in the resume that align with the JD requirements
- Missing Skills: key skills specified in the JD that are absent from the resume
- Match Score: a quantified compatibility score between the candidate and the JD
- AI Recommendation: an overall hiring recommendation (e.g., Strong Match, Partial Match, Not Recommended) based on the analysis

Upload Capabilities

- Single or bulk resume uploads in one operation
- Automatic parsing runs immediately upon upload without manual intervention
- Evaluated candidate profiles are stored and linked to the selected JD

3.5 Candidate Re-Evaluation

HireIQ supports evaluating the same candidate against multiple job descriptions, enabling teams to repurpose strong candidates for different roles without re-uploading their resume.

- Trigger a re-evaluation of any existing candidate against a new or different JD
- Previous evaluation scores and match data are retained and stored in full
- The candidate profile always displays the most recent evaluation scores by default
- View Profile shows the complete evaluation history: every JD the candidate was evaluated against, along with scores and recommendations for each

3.6 Candidate Status Management & Comments

Every candidate in the system is tracked through a structured hiring pipeline using predefined status stages. Recruiters can update the status at any point and attach comments to document decisions.

Pipeline Status Stages

New	Candidate has been evaluated and is pending review	Rejected	Candidate has been rejected from the process
Reviewed	Recruiter has reviewed the AI evaluation	Hired	Candidate has been successfully hired
Shortlisted	Candidate is shortlisted for further process	Archived	Candidate record archived for future reference
Interview	Interview has been scheduled with the candidate		

When changing a status, the recruiter can add a comment to capture context, reasoning, or follow-up notes. All status changes and comments are recorded for audit and reference purposes.

3.7 View Resume

Recruiters can view the original uploaded resume directly within the application, without needing to download or switch to an external tool. This ensures the AI-parsed summary can be cross-referenced with the source document instantly.

- In-app resume viewer for quick reference
- Original resume format preserved exactly as uploaded

3.8 Interview Scheduling

HireIQ includes a fully integrated interview scheduling system connected to Google Meet. Recruiters can manage the entire interview process without leaving the platform.

Feature	Description
Schedule Interview	Create a new interview for a shortlisted candidate with date, time, and participant details. A Google Meet link is auto-generated and sent as an invite.
Reschedule Interview	Update the interview time and notify participants automatically with a new meeting link or updated invite.
Cancel Interview	Cancel a scheduled interview, which updates the candidate's status and notifies all parties.
In-App Meet Link	The Google Meet link is accessible directly on the candidate's profile within HireIQ for quick one-click access.
Past & Cancelled View	A dedicated view lists all past and cancelled interviews, maintaining a complete scheduling history.

3.9 Bulk Status Update

When managing high volumes of candidates, HireIQ's bulk update feature allows recruiters to take action on multiple candidates simultaneously with a single operation.

- Multi-select candidates from any list view using checkboxes
- Apply a status change (e.g., Archived, Rejected, Hired) to all selected candidates in one click
- Useful post-hiring to archive or reject all remaining candidates for a position efficiently
- Supports comment addition during bulk status changes for documentation

3.10 Export to Excel

HireIQ supports exporting candidate data to Microsoft Excel for offline analysis, reporting, or sharing with stakeholders who do not have system access.

- Export candidate lists with evaluation scores, status, and key parsed details
- Filter by JD or status before exporting to get targeted data sets
- Standard .xlsx format compatible with Excel and Google Sheets

4. Application Workflow

The following section describes the end-to-end user journey through HireIQ, from initial login to final hiring decision. The workflow is designed to be linear and intuitive while supporting parallel workstreams for teams managing multiple positions.

4.1 Core Hiring Workflow

1	Login	Recruiter or manager logs in via the secure authentication page. Role-based access is applied automatically.
2	Dashboard Review	The home dashboard provides a snapshot of all open positions, candidate pipeline counts, and team workload.
3	Create / Manage JD	Recruiter navigates to JD Management, creates a new position with a full job description, assigns it to a team member, and sets its status to Open.
4	Upload Resumes	Recruiter uploads one or multiple resumes and selects the target JD. The AI engine parses and evaluates each resume against the JD.
5	Review AI Evaluation	AI-generated match scores, extracted candidate info, matching/missing skills, and hiring recommendations are displayed. Recruiter reviews the output.
6	Update Candidate Status	Recruiter changes candidate status (e.g., New → Reviewed → Shortlisted) and adds comments to document their assessment.
7	Re-evaluate (Optional)	If a candidate is better suited for a different role, the recruiter triggers a re-evaluation against a new JD. Full history is preserved.
8	View Resume	Recruiter opens the original resume within the app to validate the AI parsing and make a final assessment.
9	Schedule Interview	Recruiter schedules an interview for shortlisted candidates. A Google Meet invite is sent automatically and the link appears in-app.
10	Final Decision	After interviews, the recruiter marks the successful candidate as Hired and performs a bulk update to Reject or Archive remaining candidates.
11	Export & Report	Data is exported to Excel for record-keeping, stakeholder reporting, or further offline analysis.

4.2 Re-Evaluation Workflow

When a candidate is considered for a second position, the following sub-workflow applies:

- Locate the existing candidate profile from the candidate list

-
- Select the new target JD from the re-evaluate dropdown
 - The AI processes the same resume against the new JD and stores the new evaluation
 - The candidate profile updates to show the latest evaluation scores by default
 - All historical evaluations (JD name, date, match score, recommendation) are accessible via View Profile

4.3 Team Collaboration Workflow

HireIQ is designed for teams where multiple recruiters work under manager oversight:

- Manager creates or assigns JDs to individual recruiters via the Assigned To field
- Each recruiter manages their own queue of positions and candidates independently
- Manager monitors overall pipeline health and recruiter workload via the Dashboard
- Position filter on the Dashboard allows managers to focus on specific roles during reviews

5. User Roles & Permissions

Capability	Recruiter	Manager
Create & Edit JDs	✓	✓
Assign JD to Team Member	✓ (own)	✓ (all)
Upload & Evaluate Resumes	✓	✓
Update Candidate Status	✓	✓
Bulk Status Update	✓	✓
Schedule / Cancel Interviews	✓	✓
View Resume (in-app)	✓	✓
Export to Excel	✓	✓
Dashboard — Full Team View	✗	✓
Position Filter on Dashboard	✓ (own)	✓ (all)

6. Third-Party Integrations

Feature	Description
AWS S3	All uploaded resume files are stored securely in Amazon S3 buckets. S3 provides durable, scalable, and access-controlled file storage, ensuring resume data is reliably available to the AI processing pipeline.
Google Meet	HireIQ integrates with the Google Meet API to generate video conference links automatically when an interview is scheduled. Invites are sent to all participants and the meeting link is surfaced directly within the candidate profile in the application.
Supabase Auth	Supabase provides the authentication layer, handling secure user sign-in, session tokens, and role-based access control without requiring a custom auth implementation.

7. Feature Summary

Complete Feature List

- Secure Login & Role-Based Authentication
- Real-Time Recruitment Dashboard with Position Filtering
- Job Description Management (Create, Edit, Status, Assign)
- Single & Bulk Resume Upload
- AI-Powered Resume Parsing and JD Matching
- Match Score, Skill Gap Analysis & Hiring Recommendation
- Candidate Re-Evaluation Across Multiple JDs
- Complete Evaluation History per Candidate
- 7-Stage Candidate Status Pipeline with Comment Support
- In-App Resume Viewer
- Google Meet Interview Scheduling, Rescheduling & Cancellation
- In-App Meeting Link Access
- Past & Cancelled Interview History
- Bulk Candidate Status Update
- Excel Export of Candidate Data
